MINDNODE

Deficits

Very basic layout options

Can't move nodes around (can't change order/placement around main idea)

Does not appear to open as .rtf or mindnode visual in Google Drive

Can't collaborate in app

Better for short ideas as nodes go Really long (wraparound after long thought like this one)

While export and medication can take place with some apps, modified does not seem to be able to be imported with changes

Positive attributes
(Can import graphics)

Allows modification once saved (can be edited and/or more materials added)

https://mindnode.com/support/MindNode3_iOS_UserGuide.pdf

Has a user's guide
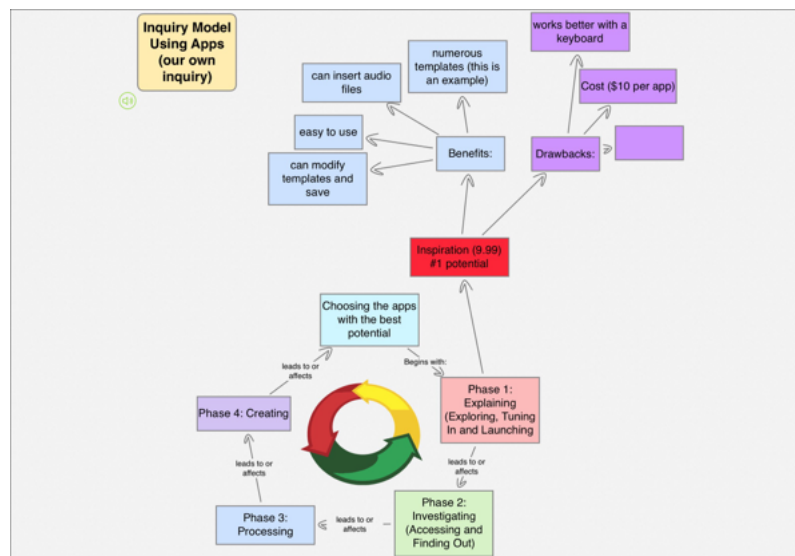

Can paste in links

Can modify text etc

How easy adding nodes I like

Can search titles

https://mail.google.com/mail/mu/mp/74/#mn

LOTS of exporting options in terms of file types

Can export as .pdf to multiple apps

Provides "my mind node" that allows,sharing online or option to embed on websites

Provides option to "fold" where nodes coming off main idea idea but can be "unfolded" at any time

Can share or embed on webpages

Easy to use

Can change colours

Inserting images I like

Autosave

Very intuitive layout

Easy to undo/modify

Plain text version can be moved to other apps (I.e. PaperPortNotes) for use and modification
